Instructions 1

Elevation of Privilege Instructions

Draw a diagram of the system you want to threat model before you deal the cards.

Deal the deck to 3–6 players. Play starts with the 3 of Tampering. Play clockwise, and each player in turn continues using the suit if they have a card in that suit. If the player doesn’t have a card from that suit, the player can use another suit. Each round is won by the highest card played in the suit that was led, unless an Elevation of Privilege (EoP) card is played. In that case the high value EoP card wins.

To play a card, read the card, announce your threat and record it. If the player can’t link the threat to the system, play proceeds.

The winner of a hand selects the card (and suit) to lead the next hand. Take a few minutes between hands to think about threats.

Points:
1 for a threat on your card, +1 for taking the trick
Elevation of Privilege Instructions

Threats should be articulated clearly, testable, and addressable. In the event that a threat leads to an argument, you can resolve it by asking the question: “Would we take an actionable bug, feature request or design change for that?” If the answer is yes, it is a real threat. (This doesn’t mean that threats outside of that aren't real, it’s simply a way to focus discussion on actionable threats.) Questions that start with “There’s a way” should be read as “There's a way...and here's how...”while questions that start with “Your code” should be read “The code we’re collectively creating...and here's how.”

The deck contains a number of special cards: trumps and open threats. EoP cards are trumps: They take the trick even if they have a lower value than the suit that was led. The ace of each suit is an open threat card. When played, the player must identify a threat not listed on another card.

When all the cards have been played, whoever has the most points wins.

Remember to have fun!
Optional variants:

- You may pass cards after the third trick. This is helpful if you have cards that you can’t tie to the system. Someone else may be able to.
- Double the number of points, and give one point for threats on other people’s cards.
- Other players may “riff” on the threat and if they do, they get one point per additional threat.
- Limit riffing to no more than 60 seconds.
- Mark up the diagram where the threat occurs.

Questions are listed on the threat cards to help with the aces.

Thanks to Laurie Williams for inspiration.
Contents:

- 2 Instruction cards
- 1 Strategy Diagram card
- 7 STRIPED Threat cards ‘suits’:
  1. Spoofing: 2-K, Ace
  2. Tampering: 3-K, Ace
  3. Repudiation: 2-K, Ace
  4. Information Disclosure: 2-K, Ace
  5. Denial of Service: 2-K, Ace
  6. Elevation of Privilege: 5-K, Ace (Trump cards)
  7. Privacy 2-K, Ace
- 7 STRIPED Threat Reference cards
- 1 About Threat Modeling and SDL card
- 1 About Privacy card

About
Threat Modeling

The Elevation of Privilege game is designed to be the easiest way to start looking at your design from a security perspective. It’s one way to threat model, intended to be picked up and used by any development group. Because the game uses STRIPED threats, it gives you a framework for thinking, and specific actionable examples of those threats.

Striped stands for:
Spoofing: Impersonating something or someone else.
Tampering: Modifying data or code.
Repudiation: Claiming not to have performed an action.
Information Disclosure: Exposing information to someone not authorized to see it.
Denial of Service: Denying or degrading service to users.
Elevation of Privilege: Gain capabilities without proper authorization.
Privacy: abusing personal data of users

At www.microsoft.com/security/sdl/eop we have videos, score sheets and tips and tricks for playing.
The Elevation of Privilege game is a fun and easy way to get started understanding the security of your systems by threat modeling. As you discover and correct design-level security problems, it’s worth thinking about the other ways security issues can creep into your code. Microsoft has a large collection of free resources available to help you get started with the Security Development Lifecycle (SDL).

To learn more about threat modeling and the Microsoft Security Development Lifecycle, visit our website at microsoft.com/sdl/
With the implementation of the General Data Protection Regulation and other privacy laws around the globe, LogMeIn and many companies have moved data protection to the beginning of the software development life cycle. Data protection by design ensures that development teams consider their relevant compliance environments and mitigate risk to personal data early on.

This Elevation of Privilege privacy extension is designed to help you integrate data protection into your threat modeling exercise, to achieve data protection by design and increase your privacy knowledge.
**Context**

- Share the rules
- Deal the deck to start play
- Play
- Wrap up

**Play**

Whoever has 3 of Tampering starts

Whoever has 3 of Tampering:

- Play card
- Document issue
- Have all players played in this hand?

  - yes
    - Record hand
    - Is there time for another hand?
    - Wrap up

  - no
    - Play proceeds to next (clockwise) player

If yes: Play starts with winner of the just-ended hand

(Taking 3 minutes to consider cards may improve flow)

Strategy: see reverse

**Strategy**

You need to select a card.

You have a card in the suit that was led?

Do you have any EoP Cards?

Card with a threat you can apply?

Do you have the high card?

Play a low card, see if anyone else has a threat

Play it so you can take lead next hand

Must play in suit: all other arrows are advice

Choice: Play EoP or another card. For example, someone else may have played the Jack of EoP, and you only have a 9.
Strategy

Spoofing

An attacker could squat on the random port or socket that the server normally uses.
elevation of privilege
Spoofing

An attacker could try one credential after another and there’s nothing to slow them down (online or offline).
elevation of privilege
Spoofing

An attacker can anonymously connect, because we expect authentication to be done at a higher level.
Microsoft
elevation of privilege

LogMeIn
Be Limitless.
Spoofing

An attacker can confuse a client because there are too many ways to identify a server.
elevation of privilege
Spoofing
An attacker can spoof a server because identifiers aren't stored on the client and checked for consistency on re-connection (that is, there's no key persistence).
elevation of privilege
Spoofing

An attacker can connect to a server or peer over a link that isn't authenticated (and encrypted).
Microsoft
elevation of privilege
LogMeIn
Be Limitless.
Spoofing

An attacker could steal credentials stored on the server and reuse them (for example, a key is stored in a world readable file).
elevation of privilege
Spoofing
An attacker who gets a password can reuse it (use stronger authenticators).
elevation of privilege
Spoofing

An attacker can choose to use weaker or no authentication.
Spoofing

An attacker could steal credentials stored on the client and reuse them.
elevation of privilege
Spoofing

An attacker could go after the way credentials are updated or recovered (account recovery doesn’t require disclosing the old password).
elevation of privilege
Spoofing

Your system ships with a default admin password and doesn’t force a change.
Spoofing
You’ve invented a new Spoofing attack.
elevation of privilege
Tampering

An attacker can take advantage of your custom key exchange or integrity control which you built instead of using standard crypto.
Tampering

Your code makes access control decisions all over the place, rather than with a security kernel.
elevation of privilege
Tampering

An attacker can replay data without detection because your code doesn’t provide timestamps or sequence numbers.
elevation of privilege
Tampering
An attacker can write to a data store your code relies on.
An attacker can bypass permissions because you don’t make names canonical before checking access permissions.
elevation of privilege
Tampering

An attacker can manipulate data because there’s no integrity protection for data on the network.
elevation of privilege
Tampering

An attacker can provide or control state information.
elevation of privilege
Tampering

An attacker can alter information in a data store because it has weak ACLs or includes a group which is equivalent to everyone (“all Live ID holders”).
elevation of privilege
Tampering

An attacker can write to some resource because permissions are granted to the world or there are no ACLs.
elevation of privilege
Tampering

An attacker can change parameters over a trust boundary and after validation (for example, important parameters in a hidden field in HTML, or passing a pointer to critical memory).
elevation of privilege
Tampering

An attacker can load code inside your process via an extension point.
Tampering

You've invented a new Tampering attack.
An attacker can pass data through the log to attack a log reader, and there’s no documentation of what sorts of validation are done.
elevation of privilege
Repudiation
A low privilege attacker can read interesting security information in the logs.
elevation of privilege
Repudiation

An attacker can alter files or messages because the digital signature system you’re implementing is weak, or uses MACs where it should use a signature.
An attacker can alter log messages on a network because they lack strong integrity controls.
elevation of privilege
Repudiation

An attacker can create a log entry without a timestamp (or no log entry is timestamped).
Repudiation

An attacker can make the logs wrap around and lose data.
elevation of privilege
Repudiation

An attacker can make a log lose or confuse security information.
elevation of privilege
Repudiation

An attacker can use a shared key to authenticate as different principals, confusing the information in the logs.
Microsoft

elevation of privilege

LogMeIn

Be Limitless.
Repudiation

An attacker can get arbitrary data into logs from unauthenticated (or weakly authenticated) outsiders without validation.
elevation of privilege
Repudiation

An attacker can edit logs and there’s no way to tell (perhaps because there’s no heartbeat option for the logging system).
elevation of privilege
Repudiation

An attacker can say “I didn’t do that,” and you would have no way to prove them wrong.
Repudiation
The system has no logs.

logs = 0
elevation of privilege
Repudiation

You’ve invented a new Repudiation attack.
Information Disclosure

An attacker can brute-force file encryption because there's no defense in place (example defense: password stretching).
elevation of privilege
Information Disclosure

An attacker can see error messages with security-sensitive content.
elevation of privilege
Information Disclosure

An attacker can read content because messages (for example, an email or HTTP cookie) aren’t encrypted even if the channel is encrypted.
elevation of privilege
Information Disclosure

An attacker may be able to read a document or data because it's encrypted with a non-standard algorithm.
elevation of privilege
Information Disclosure

An attacker can read data because it’s hidden or occluded (for undo or change tracking) and the user might forget that it’s there.
elevation of privilege
An attacker can act as a “man in the middle” because you don’t authenticate endpoints of a network connection.
elevation of privilege
Information Disclosure

An attacker can access information through a search indexer, logger, or other such mechanism.
Information Disclosure

An attacker can read sensitive information in a file with bad ACLs.
elevation of privilege
An attacker can read information in files with no ACLs.
elevation of privilege
Information Disclosure

An attacker can discover the fixed key being used to encrypt.
elevation of privilege
Information Disclosure

An attacker can read the entire channel because the channel (for example, HTTP or SMTP) isn’t encrypted.

Don’t tell anyone, but...
elevation of privilege
Information Disclosure

An attacker can read network information because there’s no cryptography used.

What!*#@!
No cryptography was used?
You’ve invented a new Information Disclosure attack.
Denial of Service

An attacker can make your authentication system unusable or unavailable.
Denial of Service

An attacker can make a client unavailable or unusable but the problem goes away when the attacker stops (client, authenticated, temporary).
elevation of privilege
An attacker can make a server unavailable or unusable but the problem goes away when the attacker stops (server, authenticated, temporary).
elevation of privilege
Denial of Service

An attacker can make a client unavailable or unusable without ever authenticating, but the problem goes away when the attacker stops (client, anonymous, temporary).
elevation of privilege
Denial of Service

An attacker can make a server unavailable or unusable without ever authenticating, but the problem goes away when the attacker stops (server, anonymous, temporary).
Denial of Service

An attacker can make a client unavailable or unusable and the problem persists after the attacker goes away (client, authenticated, persistent).
elevation of privilege
Denial of Service

An attacker can make a server unavailable or unusable and the problem persists after the attacker goes away (server, authenticated, persistent).
