

Automatically update third-party applications

Protect your software and systems against potential threats with Application Updates.

As the cyber-threat landscape continues to evolve, the need to protect and manage endpoints both efficiently and effectively becomes more and more difficult. To meet the challenge, you need a dedicated view of which systems require important security patches, and you must be able to push those updates remotely and automatically.

Application Updates for Central Premier is a patch management solution that allows you to quickly identify vulnerable third-party applications and automatically deploy patches to keep your software up to date and protected against potential threats.

With Application Updates, you can get a clear view into out-of-date software and better manage your IT assets:

- **Monitor** computers for software that is outdated or at risk, including Adobe, Java, web browsers and more
- **Push** software updates directly through the LogMeIn dashboard to all or select computers and groups
- **Manage** and perform multiple updates silently without interruption to end users or remote computers
- **Automate** software updates on remote computers to prevent future issues

Central Premier customers using Application Updates have directly benefited from:

- **Greater insight** into a broader array of software on every computer in their LogMeIn dashboard
- **Less time** spent on maintenance and more time on strategy thanks to streamlined updates
- **Stronger confidence** in the security of their endpoints through proactive management of issues
- **Flexible, efficient control** over their networks with automated and scheduled updates
